PATENT

What is claimed is:

1. A medical electrical lead, comprising:

a lead body including a distal end, a first elongated insulated conductor extending toward the distal end and a first electrode coupled to the first conductor;

a second elongated insulated conductor including a first portion extending within the lead body to the distal end and a second portion extending distally from the distal end of the lead body;

a tissue anchor terminating the second portion of the second conductor and including a surface for receiving a push force from an insertion tool adapted to insert the anchor within a segment of tissue such that the first electrode of the lead body is in close proximity to the segment of tissue; and

a second electrode mounted on the tissue anchor and coupled to the second conductor.

- 2. The medical electrical lead of claim 1, wherein the second portion of the second conductor forms a helix in between the distal end of the lead body and the anchor.
- 3. The medical electrical lead of claim 1, wherein the surface of the anchor extends laterally from the second portion of the second conductor.
- 4. The medical electrical lead of claim 1, wherein the surface of the anchor forms a recess.
- 5. The medical electrical lead of claim 1, wherein the anchor comprises a resilient tine member.
- 6. The medical electrical lead of claim 1, wherein the anchor comprises a substantially spherical member.

- 7. The medical electrical lead of claim 1, wherein the anchor comprises a substantially conical member.
- 8. The medical electrical lead of claim 1, further comprising means promoting chronic adhesion of the lead body to the segment of tissue; the means positioned in proximity to the distal end of the lead body.
- 9. A medical electrical lead, comprising:

a lead body including a distal end, a first elongated insulated conductor extending toward the distal end and a first electrode coupled to the first conductor;

a second elongated insulated conductor including a first portion extending within the lead body to the distal end and a second portion extending distally from the distal end of the lead body;

a tissue anchor terminating the second portion of the second conductor and including means for receiving a push force from an insertion tool adapted to insert the anchor within a segment of tissue such that the first electrode of the lead body is in close proximity to the segment of tissue; and

a second electrode mounted on the tissue anchor and coupled to the second conductor.

10. A medical implant system, comprising:

a medical electrical lead body including a distal end, a first elongated insulated conductor extending toward the distal end and a first electrode coupled to the first conductor;

a second elongated insulated conductor including a first portion extending within the lead body to the distal end and a second portion extending distally from the distal end of the lead body;

a tissue anchor terminating the second portion of the second conductor;

a second electrode mounted on the tissue anchor and coupled to the second conductor; and

an insertion tool adapted to push the anchor into a segment of tissue in order to implant the first electrode in proximity to the tissue and the second electrode within the segment of tissue;

wherein the anchor includes a surface receiving the push from the insertion tool.

- 11. The implant system of claim 10, wherein the insertion tool comprises a needle including a lumen adapted to slideably engage the lead body.
- 12. The implant system of claim 11, wherein the needle further includes an protrusion extending into the lumen and interfacing with the surface of the anchor to push the anchor.
- 13. The implant system of claim 11, wherein the insertion tool further comprises a push tube slidably engaged within the needle lumen and slidably engaged about the lead body; the push tube including a distal end interfacing with the surface of the anchor to push the anchor.
- 14. The implant system of claim 10, wherein the second portion of the second conductor forms a helix in between the distal end of the lead body and the anchor.
- 15. The implant system of claim 10, wherein the anchor comprises a member selected from the group consisting of a resilient tine, a substantially spherical member, and a substantially conical member.
- 16. The implant system of claim 10, wherein: the insertion tool comprises a stylet including a distal end; and the surface of the anchor forms a recess receiving the distal end of the stylet.
